

The PacSimulate Platform

Having the right mix of cartons for parcel shipping has traditionally been a “best guess,” often with the aid of consultants, with any change happening at most once every few years. This leads to unnecessary shipping costs, wasted material, and unhappy customers. Paccurate can fix that.

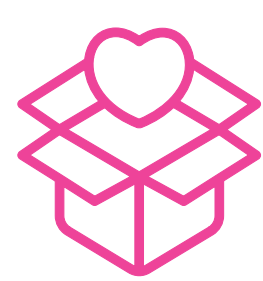

PacSimulate analyses thousands of shipments to determine the best mix of carton sizes to use in your DCs and stores. It is the only technology of its kind that optimizes directly for shipping costs.

It's also the easiest way to reduce costs, meet ESG goals, and delight your customers.

Increase margins on parcel shipments

Save up to 15% on shipping costs just from updating your boxes.

Improve customer experience

Less waste for your customers to deal with.

Run Greener

Reduce SCOPE-3 emissions from cardboard, filler, and shipping.

PacSimulate allows you to customize your goals, and simulate different scenarios. It continually identifies the cost-optimal mix of cartons to keep in stock and tells you exactly how your shipping costs will be effected.

There are no integration requirements.

Paccurate API users can opt-in at any time. If you're not an API user yet, there's no technical integration or process changes required. Simply upload a spreadsheet of orders as often as you like, and we'll do the rest. And we're always here to help.
